

HPL - HPG Series multiple pumps

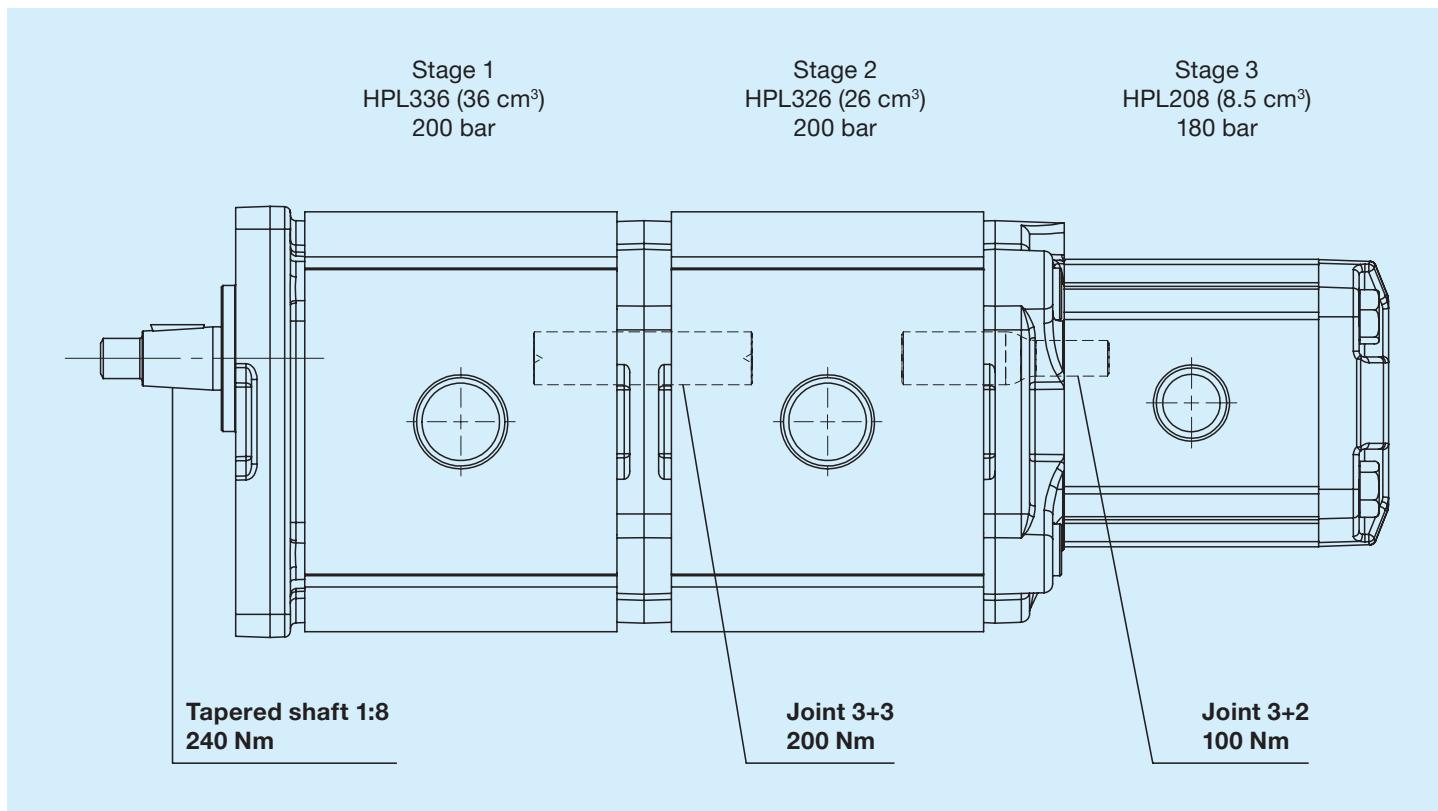

## Introduction

HPL + HPL multiple pumps are combinations of two or more sections driven by a single shaft. The sections making up the multiple pump are driven by splined joints. This multiple pump configuration can have inlet and delivery for each stage or, where possible, a single inlet and several deliveries. For individual sections, the values given in the catalogue apply, with some pressure limitations depending on the maximum torque of the drive joint and the shaft profile.

The maximum speed of a multiple pump is the lowest maximum speeds of the individual stages.

A useful example for correctly dimensioning the torque that can be transmitted to the shaft profile and for each individual stage of a group 3 + group 3 + group 2 triple pump at a given operating pressures on each stage is provided below.

## Triple pump example HPLPC336D32G7G71326G6G6208G4G4SG

The formula for calculating the torque to be used is:

$$M = \frac{\Delta p \cdot c}{62,83 \cdot \eta_m} \quad [Nm]$$

where:

**M** = Torque (Nm)

**Δp** = Pressure (bar)

**c** = Pump displacement (cm<sup>3</sup>)

**62,83** = Conversion factor

**ηm** = Mechanical efficiency = 0.9

The calculation is made out from the last stage of the pump up to the primary shaft. In all stages, the resulting calculated torque must be less than or equal to the maximum permissible torque for each drive joint, including the profile of the pump shaft.

### **Stage 3:**

Group 2, displacement 8.5 cm<sup>3</sup>, operating pressure 180 bar.  
 $M_3 = 27.06 \text{ Nm}$ .  
 The joint 2 condition is met (maximum limit 100 Nm).

### **Stage 2:**

Group 3, displacement 26 cm<sup>3</sup>, operating pressure 200 bar.  
 $M_2 = 91.96 \text{ Nm}$ .  
 $M_3 + M_2 = 119.02 \text{ Nm}$ .  
 The joint condition 1 is met (maximum limit 200 Nm).

### **Stage 1:**

Group 3, displacement 36 cm<sup>3</sup>, operating pressure 200 bar.  
 $M_1 = 127.32 \text{ Nm}$ .  
 $M_3 + M_2 + M_1 = 246.34 \text{ Nm}$ .  
 The drive shaft condition is NOT met (maximum limit 240 Nm).

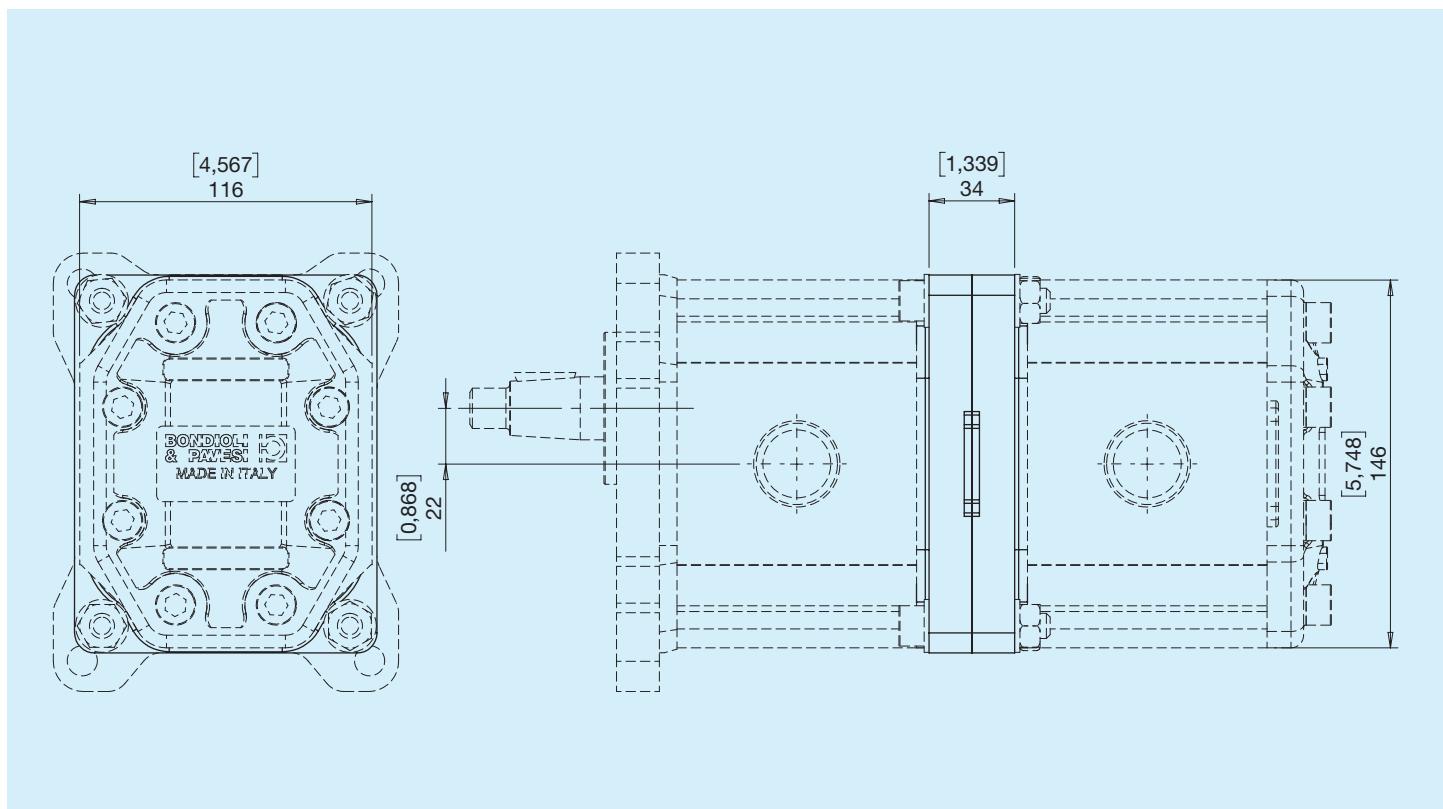

The operating pressure or displacement must be lowered, assuming the operating pressure 180 bar  $M_1 = 114.59 \text{ Nm}$ .  
 $M_3 + M_2 + M_1 = 233.61 \text{ Nm}$ .  
 The drive shaft condition is met (maximum limit 240 Nm).

Coupling joint	Maximum transmitted torque
HPLP3 + HPLP3	200 Nm
HPLP3 + HPLP2 HPLP2 + HPLP2	100 Nm
HPLP3 + HPLP1 HPLP2 + HPLP1 HPLP1 + HPLP1	30 Nm

**Introduction**

HPG + HPG multiple pumps are combinations of two or more sections driven by a single shaft. The sections making up the multiple pump are driven by splined joints. This multiple pump configuration can have inlet and delivery for each stage or, where possible, a single inlet and several deliveries. For individual sections, the values given in the catalogue apply, with some pressure limitations depending on the maximum torque of the drive joint and the shaft profile.

The maximum speed of a multiple pump is the lowest maximum speeds of the individual stages.

A useful example for correctly dimensioning the torque that can be transmitted to the shaft profile and for each individual stage of a group 3 + group 3 + group 2 triple pump at a given operating pressures on each stage is provided below.

**Triple pump example HPGPC322D29E7E5B322E5E5G205E3E3ST**

The formula for calculating the torque to be used is:

$$M = \frac{\Delta p \cdot c}{62,83 \cdot \eta_m} \quad [Nm]$$

where:

**M** = Torque (Nm)

**Δp** = Pressure (bar)

**c** = Pump displacement (cm<sup>3</sup>)

**62,83** = Conversion factor

**ηm** = Mechanical efficiency = 0.9

The calculation is made out from the last stage of the pump up to the primary shaft. In all stages, the resulting calculated torque must be less than or equal to the maximum permissible torque for each drive joint, including the profile of the pump shaft.

### **Stage 3:**

Group 2, displacement 4.5 cm<sup>3</sup>, operating pressure 210 bar.  
M<sub>3</sub> = 16.7 Nm.  
The joint 2 condition is met (maximum limit 100 Nm).

### **Stage 2:**

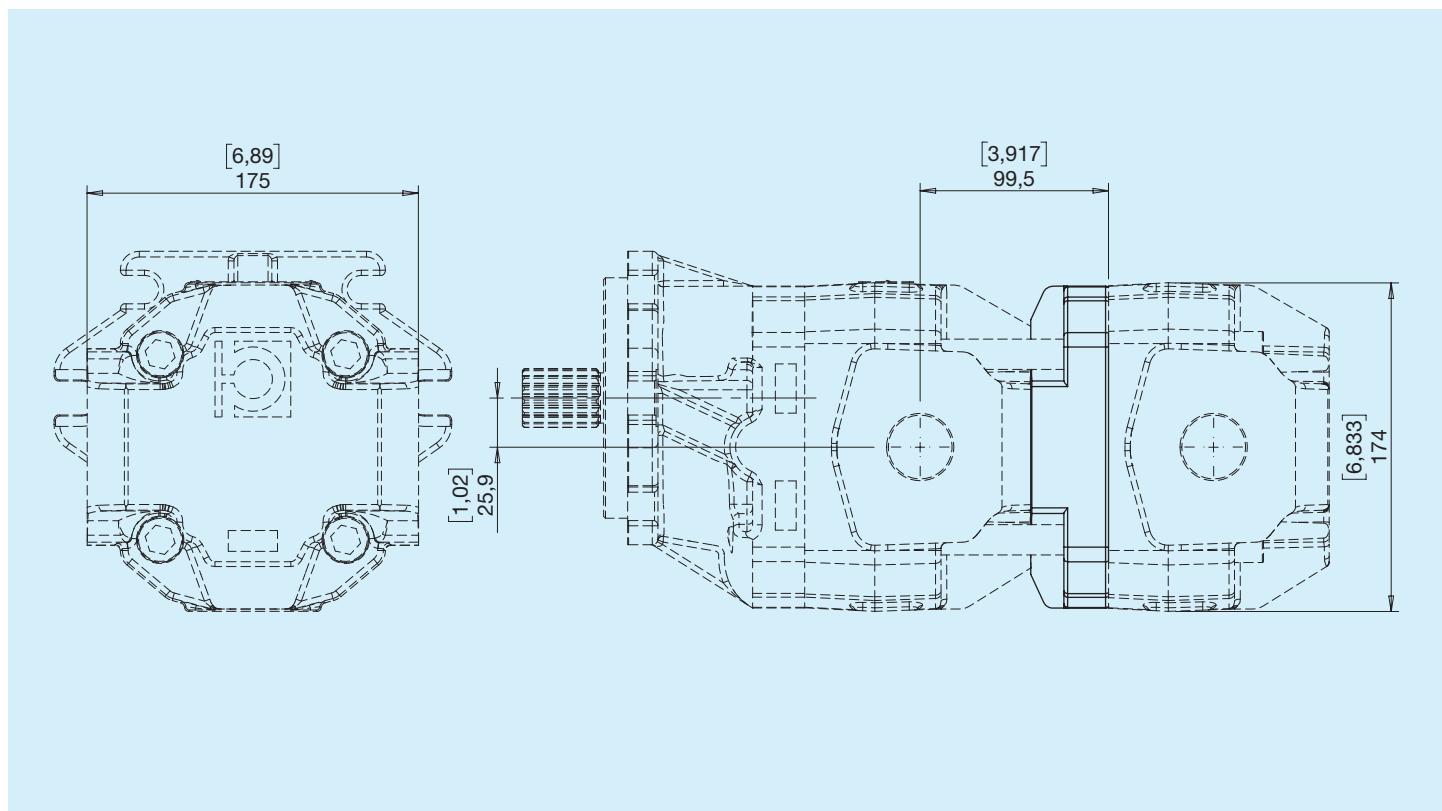

Group 3, displacement 26 cm<sup>3</sup>, operating pressure 200 bar.  
M<sub>2</sub> = 91.96 Nm.  
M<sub>3</sub> + M<sub>2</sub> = 119.02 Nm.  
The joint condition 1 is met (maximum limit 200 Nm).

### **Stage 1:**

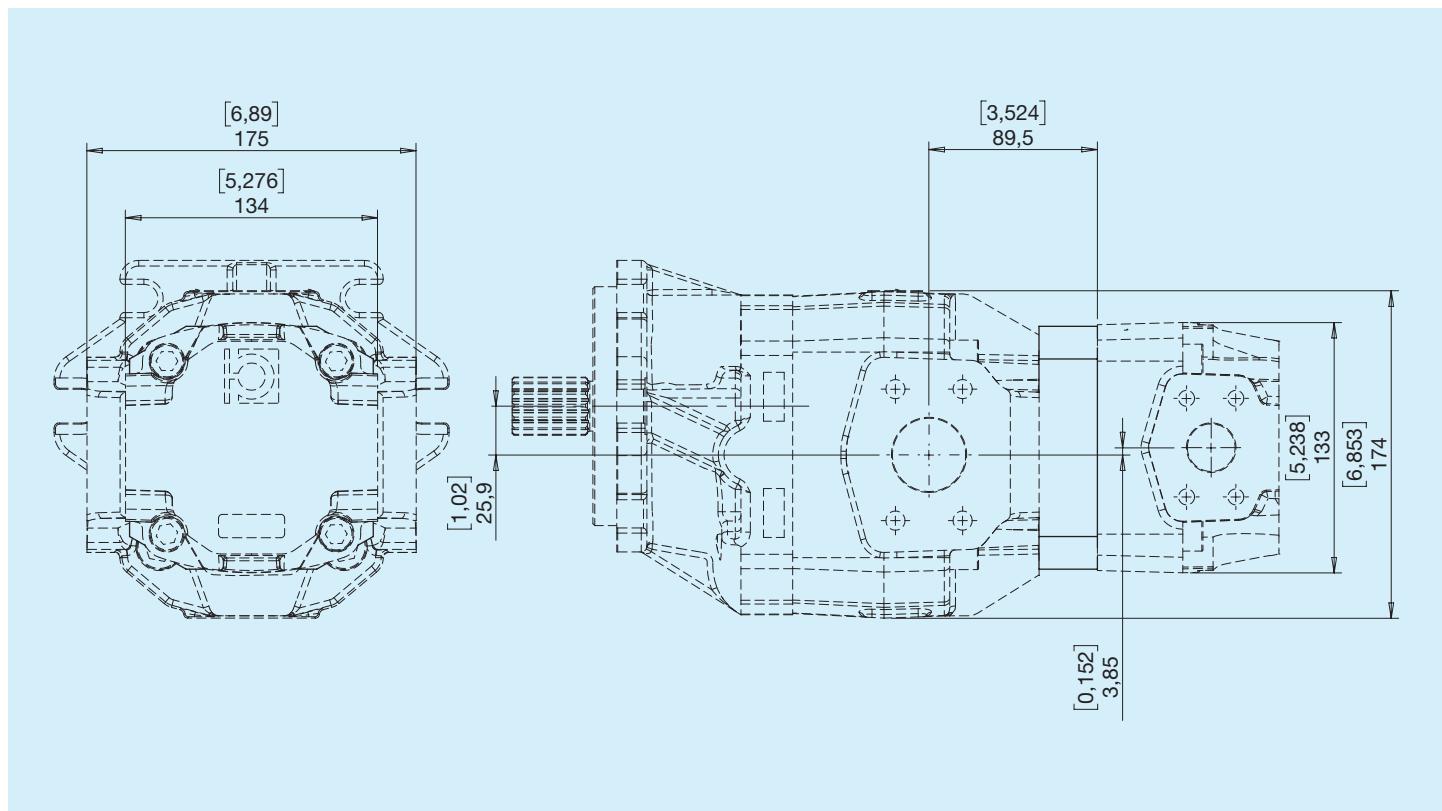

Group 3, displacement 21.5 cm<sup>3</sup>, operating pressure 200 bar.  
M<sub>1</sub> = 76 Nm.  
M<sub>3</sub> + M<sub>2</sub> + M<sub>1</sub> = 160.7 Nm.  
The drive shaft condition is met (maximum limit 010 Nm).
